Client-Server Communication

Q: Transport layer works within the host. So how is there a TCP/ UDP communication between diff hosts?

A:

Q: What was the reason that we can't run server for the second time?

A: The OS is complaining that a socket is already bound to the port we want to bind a socket to. Might have been left over from previous instance and garbage collection may not have happened yet. Also server programs are not intended to be closed and run frequently.
